The whole medical file, read once.
Every value one click from its page.

Epicrisis turns scanned medical records in five languages into a structured archive that runs on your own servers. Your underwriter sees the full history of a case in one place, can question it through an AI assistant, and every answer points back to the scan. **The archive shows what the documents say. Your people decide.**

DEMO DATA, INVENTED PATIENT. FIFTEEN VALUES OF ONE TEST OVER FIFTEEN YEARS: RUSSIAN FORMS FIRST, ENGLISH AFTER HE MOVED. THE SHADED BAND IS THE RANGE PRINTED ON EACH FORM, NOTHING RECALCULATED: WHERE A FORM PRINTED NO RANGE THERE IS NO BAND. EVERY VALUE HAS A DATE, A LABORATORY AND A SCAN BEHIND IT.

01 WHAT THE UNDERWRITER GETS

One timeline per test across laboratories, countries and languages. Units are kept as printed; mg/dL and µmol/L never land on one chart.

When it started. The first value outside the range printed on its own form, dated and linked to that form — the question behind every pre-existing condition review. This one is of the third mode below: the application compares nothing in the other two.

Checks with no model at all: the same result filed three times, a stored number that differs from the print, a date nobody could read.

Plain-language questions through Claude or ChatGPT (MCP). Read-only. Each answer carries file, page and date.

02 WHY IT FITS AN INSURER

Three modes, strictest by default. *As printed*: shown as the forms wrote it, nothing compared. *May also read the values*: a model may say what a value means; the application still computes nothing. *No limits set here*: the model answers under no rule of ours, and only here does the application itself compare a number with the range printed beside it and count what fell outside. Your instance, your choice, on its own Settings page.

Inside your perimeter. Self-hosted, no vendor cloud, no telemetry. Model calls go out with your own key, one document per call, or not at all.

One archive per case, isolated by construction. Cases never mix.

Evidence, not verdicts. It extracts and cites; it does not score, price or decide. Under the EU AI Act, AI for risk assessment and pricing in life and health insurance is high-risk. Scoring stays with your team.

Source-available. Your IT and compliance read every line before it is installed; a commercial licence covers running it. Nothing is hidden and nothing is free-riding.

01

Medical underwriting

A full case history before the decision, not a stack of PDFs.

02

Claims and pre-existing conditions

When a value first left the range printed on its form, against the policy start date. Third mode.

03

Post-issue review

Contestability and audit work with the page behind every number.

04

Cross-border cases

IPMI, assistance and expat files in RU, UK, EN, ES and EL.

600+	6,000+	2063	1989–2026	150+
DOCUMENTS READ	VALUES AS PRINTED	TESTS IN THE SUITE	YEARS COVERED	CLINIC NAMES · 5 LANGUAGES

Looking for two or three underwriting or claims teams for a pilot.

Your own files, on your own server. We learn what your reviewers actually need; you keep everything. A data processing agreement under Article 28 GDPR comes with the licence.
